1. Introduction

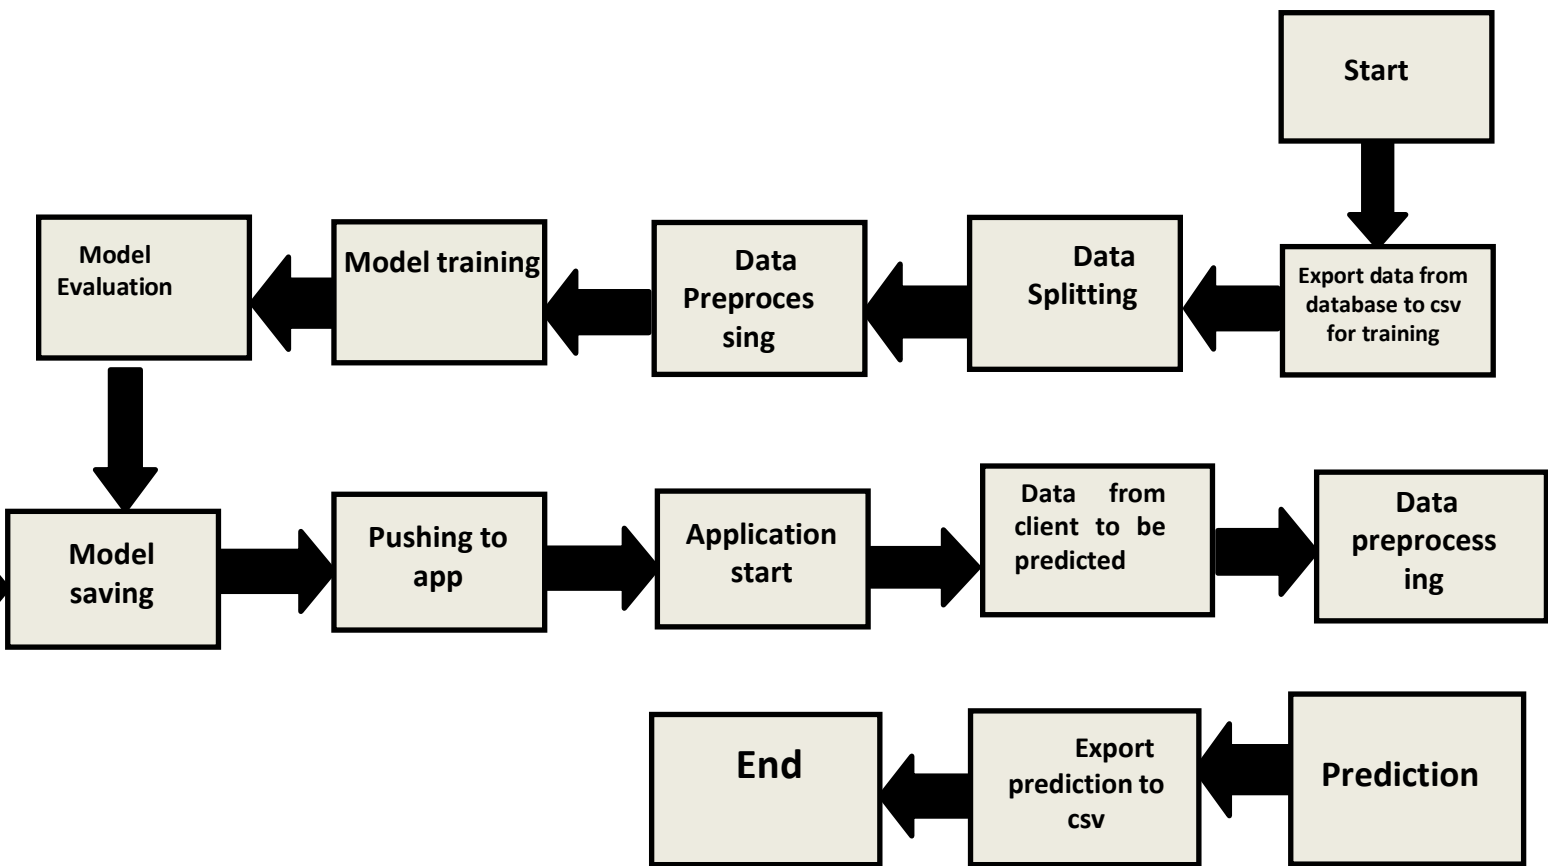

What is Low-Level design document?

The goal of LLD or a low-level design document (LLD) is to give the internal logical design of the actual program code for Thyroid Disease Detection System. LLD describe the class diagrams with the methods and relations between classes and program specs. It describes the modules so that the programmer can directly code the program from the document.

Scope

Low-level design (LLD) is a component-level design process that follows a step-by-step refinement process. This process can be used for designing data structures, required software architecture, source code and ultimately, performance algorithms. Overall, the data organization may be defined during requirement analysis and then refined during data design work.

2. Architecture

3. Architecture Description

Data Description

We will be using Mushroom Classification Data Set present in UCI Machine Learning Repository. This Data set is satisfying our data requirement. Total 8125 instances present in different batches of data.

Export Data from database to CSV for Training

Here we will be exporting all batches of data from database into one csv file for training.

Data Splitting

We split the data here for our train and test data for further uses.

Data Preprocessing

We will be exploring our data set here and perform data preprocessing depending on the data set. We first explore our data set in Jupyter Notebook and decide what pre-processing and validation we have convert categorical values to numerical values by Label encoding and then we have to write separate modules according to our analysis, so that we can implement that for training as well as prediction data.

Model Training

We trained various model in our notebook and SVC was good on it. We trained with our processed data.

Model Evaluation

Model evaluation done by classification and report was saved.

Model Saving

We will save our models so that we can use them for prediction purpose.

Push to app

Here we will do cloud setup for model deployment. We also create our streamlit app and user interface and integrate our model with streamlit app and UI.

Data from client side for prediction purpose

Now our application on cloud is ready for doing prediction. The prediction data which we receive from client side.

Data processing

Client data will also go along the same process Data pre-processing and according to that we will predict those data.

Export Prediction to CSV

Finally when we get all the prediction for client data, then our final task is to export prediction to csv file and hand over it to client.

4 Unit Test Cases

Test Case Description	Pre-Requisite	Expected Result
Verify whether the Application URL is accessible to the user	1. Application URL should be defined	Application URL should be accessible to the user
Verify whether the Application loads completely for the user when the URL is accessed	1. Application URL is accessible 2. Application is deployed	The Application should load completely for the user when the URL is accessed
Verify whether the User is able to sign up in the application	1. Application is accessible	The User should be able to sign up in the application
Verify whether user is able to successfully login to the application	1. Application is accessible 2. User is signed up to the application	User should be able to successfully login to the application
Verify whether user is able to see input fields on logging in	1. Application is accessible 2. User is signed up to the application 3. User is logged in to the application	User should be able to see input fields on logging in
Verify whether user is able to edit all input fields	1. Application is accessible 2. User is signed up to the application 3. User is logged in to the application	User should be able to edit all input fields
Verify whether user gets Submit button to submit the inputs	1. Application is accessible 2. User is signed up to the application 3. User is logged in to the application	User should get Submit button to submit the inputs
Verify whether user get prediction/output back after submitting the inputs	1. Application is accessible 2. User is signed up to the application 3. User is logged into the application	User should get their output after submitting the inputs.
Verify whether the output which user gets is accordance to inputs user made.	1. Application is accessible User is signed up to the application 3. User is logged into the application	The output should be in accordance with the inputs user made.
Verify whether user have option to download their result or not.	1. Application is accessible User is signed up to the application 3. User is logged into the application	User should have option to download their output result.
